

Distribution of the Endemic Cuban Genus *Hemithrinax* (Arecaceae)

Distribución del Género Endémico Cubano *Hemithrinax* (Arecaceae)

DUANNY SUÁREZ OROPESA, AND DONALD R. HODEL

Abstract

Based on 121 herbarium specimens and the authors' field observations for more than 25 years of *Hemithrinax* in Cuba, we document its distribution by provinces or municipalities and its biogeographic distribution by sub-provinces, sectors, and districts.

Resumen

Basado en el reporte de 121 especímenes de herbario y de las observaciones de campo de los autores durante más de 25 años de *Hemithrinax* en Cuba, documentamos su distribución por provincias o municipios y su distribución biogeográfica por subprovincias, sectores y distritos.

Introduction

The Arecaceae (Palmae) family is represented in Cuba by 15 genera and 98 infrageneric taxa: 80 species; 10 infraspecific taxa; and 8 hybrids. Of the total, 85 infrageneric taxa are endemic (86.7 %), one of the highest proportions among the plant families in the country (Moya and Leiva 2000, Moya 2020 unpublished).

Dransfield et al. (2008) placed *Hemithrinax* in the Cryosophileae tribe of the subfamily Coryphoideae. The genus *Hemithrinax* is closely related to *Leucothrinax* and for some time the two were even included in *Thrinax*; however, molecular studies showed that the three genera originated from different phylogenetic lineages and should be separated (Lewis and Zona 2008). Although Borhidi and Muñiz (1985) had transferred *Hemithrinax* to *Thrinax*, we follow Lewis and Zona (2008) and treat them separately.

Hemithrinax, represented by three species and a recognized variety, is the only Cuban endemic palm genus. One, *H. ekmaniana*, is restricted to the west-central region while *H. compacta* and *H. rivularis* var. *rivularis* and *H. rivularis* var. *savannarum* are restricted to the east (Fig. 1). It is easily differentiated from the *Coccothrinax* in its leaf bases, which open in an inverted V, like those of *Thrinax* and *Leucothrinax*; however, it differs from these latter two genera in its faint (rather than conspicuous) transverse veinlets (Lewis and Zona 2008).

1. Map of Cuba showing distribution of *Hemithrinax*. *H. compacta*: brown star = herbarium specimen data, brown circle = observation; *H. ekmaniana* = green star (north of Santa Clara); *H. rivularis* var. *rivularis* = red star; *H. rivularis* var. *savannarum* = blue star.

Moya (2019) updated the taxonomy and nomenclature of *Hemithrinax* as well as distribution by provinces only. The purpose of this paper is to update the geographical and biogeographic distribution of *Hemithrinax*.

Materials and Methods

We gathered information about the distribution of *Hemithrinax* from herbarium specimens, locations cited in the literature (bibliographic references), our field observations, and personal communications with other knowledgeable colleagues.

We examined and obtained location data from 121 specimens of *Hemithrinax* at the following herbaria: AJBC, B, BH, BRU, FI, FTG, G, GB, GH, GOET, HAC, HAJB, HMC, K, LE, MICH, MO, MT, NY, P, PAL, S, ULV, US, and YU (acronyms follow Thiers 2016). We also reviewed all pertinent material in the National Herbarium of Cuba "Onaney Muñiz" of the Institute of Ecology and Systematics (HAC). All specimens cited were examined from high-resolution photographs except for those at AJBC, HAC, and ULV, which we examined in person. Specimens seen by the

authors are marked with “!”, those not seen with “[n.v.]”, and those without marks were digital images.

Literature accounts of Burret (1929), León (1941), Saakov (1970), Morici (2000), Castañeda et al (2006), Falcón et al. (2004), Reveal and Nixon (2013), and Rodriguez et al. (2017) provided additional distribution and general information.

We have maintained field observation records for the last 26 years, from 1994 to 2020. Locations generally refer to the nearest place of habitation in instances where locations are unnamed. Rodríguez’s field observation number system is in this format: *MRXX.XX*. Moya’s field observation number system is in this format: *Serie Moya XXXX*. We also obtained location information from colleagues (personal communications).

Borhidi (1985), who considered *Hemithrinax* a subgenus of *Thrinax*, provided a distribution map of *Hemithrinax* that apparently dates to 1973, and later used the map again (Borhidi 1996). In this 1996 account, Borhidi discussed and outlined the biogeography of Cuba, which we follow here, and that Moya (2019) updated for *Hemithrinax*.

The geographical information includes the country in capital letters, followed in alphabetical order by the province with the municipalities in parentheses. The biogeographic information includes the province in capital letters, followed by the subprovince and the corresponding sector, with the districts in parentheses. The origin of the information used for each municipality or district is marked by adding (H) for herbarium specimen, (R) for bibliographic reference, (A) for authors’ observations, and (P) for personal communication. We have no updated information for omitted municipalities or districts.

Results and Discussion

Geographical Distribution. CUBA. Province Villa Clara (Sagua la Grande^H: Mogotes de Jumagua).

Biogeographical Distribution. Province **CUBA**, subprovince Central Cuba, sector Camagüeyicum (Sagüense^H) (Borhidi 1996).

Hemithrinax rivularis León, Mem. Soc. Cub. Hist. Nat. "Felipe Poey" 15: 380. 1941.

When León (1941) named and described *Hemithrinax rivularis* and *H. savannarum*, he noted that the former differed from the latter in its habitat (moist areas in woodlands vs. drier areas in low scrublands); habit (trunk to 8 m tall vs. acaulescent or very short); petiole (exceeding the apical free part of the leaf base vs. shorter than the apical free part of the leaf base); fruit (subglobose vs. globose); and the seed (hilum elliptic, embryo subapical, and seed coat intrusion broadly columnar vs. hilum linear or narrowly lanceolate, embryo lateral, and seed coast intrusion narrowly columnar). Later, Muñiz (in Muñiz and Borhidi 1982) reduce the latter to a variety of the former. Here, we recognize these two varieties but admit that rigorous, likely molecular work will be needed to confirm our interpretation.

Suárez field observations. CUBA. Holguín province. Moa municipality, Jiguaní river, 27 Jan. 2007; 8 Apr. 2017; 24 May 2017; 1 Dec. 2018; Yaguaneque, 9 Dec. 2012; 21 May. 2016; 19 Jan. 2017; Cañete, 19 Jun. 2017; 1 Dec. 2018; Los Checos, 26 Sep. 2019.

Moya field observations. CUBA. Holguín province, Moa municipality: road to Juracal to the left, 12 Oct. 2015, Serie Moya 1506.

Geographical Distribution. CUBA. Provinces Holguín (Moa^H) and Guantánamo (Baracoa^H). Updated by Moya (2019).

7. Map showing distribution of *Hemithrinax rivularis* var. *rivularis* = red star; *H. rivularis* var. *savannarum* = blue star.

Biogeographical Distribution. Province **CUBA**, subprovincia Eastern Cuba, sector Moanicum (Moaëns^H). (Borhidi 1996).

Hemithrinax rivularis* var. *savannarum (León) O. Muñiz, Acta Bot. Acad. Sci. Hung. 28: 312. 1982. **Figs. 1, 7–8.**

≡ *Hemithrinax savannarum* León, Mem. Soc. Cub. Hist. Nat. "Felipe Poey" 15: 381. 1941.

≡ *Thrinax rivularis* var. *savannarum* (León) Borhidi & O. Muñiz, Acta Bot. Hung. 31: 226. 1985.

Specimens Examined. **CUBA.** PROVINCE Holguín, municipality Moa: Sabanas algo húmedas, Moa, 21 Jul. 1941, León 20101 (holotype, HAC! [2 sheets]; isotypes, US [3 sheets]); Cerro de Miraflores, Cananova, Jul. 1942, León 21069 (HAC!); Playa de Moa, 27 May 1943, Ma. Victorin 21707 (HAC!, MT); Cayo Coco, Moa, 15 Apr. 1945, Acuña 12376 (HAC!, US [n.v.]); Camino a Juracal, 12 Oct. 1015, Verdecia & Moya RV15/16 (HMC [n.v.]).

Rodríguez field observations. **CUBA.** Holguín province. Moa municipality, Yaguaneque, 2 Dec. 2012, Rodríguez MR12.23.

8. *Hemithrinax rivularis* var. *savannarum* growing in serpentine soil, Holguín, Moa, Yaguaneque. © 2018 Duanny Suárez Oropesa.

Suárez field observations. CUBA. Holguín province. Moa municipality, Yaguaneque, 29 Sep. 2019.

Moya field observations. CUBA. Holguín province, Moa municipality: road to Juracal to the right, 12 Oct. 2015, *Serie Moya 1507*.

Geographical Distribution. CUBA. Provinces Holguín (Moa^H).

Biogeographical Distribution. Province **CUBA**, subprovincia Eastern Cuba, sector Moanicum (Moaënse^H). (Borhidi 1996).

Acknowledgements

We thank HAC for use of the facilities to examine its specimens and especially Bertha L. Toscano Silva for her great help during the review of the collections. We thank Idalmis Granado Moíña and Anel Matos Viñales for their help in the field work; José Luis Gómez Hechavaría for the

information in his personal records and photos of *Hemithrinax compacta* in the new locality in Mayarí; Raul M. Verdecia Pérez for photos of collections at HMC; Lázaro Granado Duque, Yanetsi Ramírez Granado, Herminia González López, Rafael Martín Hernández, María del Carmen Fajilde, and Geovanis Rodríguez Coba for their logistical support of the senior author; Daimaris Romero Mena for his help in field work and organization of samples and other information; the late Ángela T. Leiva Sánchez for encouraging our to study of *Hemithrinax*; and an anonymous reviewer for checking the manuscript and making helpful suggestions. All have our sincere thanks.
